

Optimized & Available Networks

PRESS RELEASE

For immediate release

Montreal, Canada - February 1, 2006

Elfiq Solutions (Elfiq inc.) expands coverage in Europe with new offices in Hook, Hampshire, near London (United Kingdom).

Following its recent entrance into the United States market and the release of its real-time dispersed geographic module last year, Elfiq has continued its expansion with the opening of a new office in Europe, located in the United Kingdom near London. Elfiq is pleased to announce that Mark Hyland has accepted the position of Regional Director.

"The high volume of electronic exchanges makes IP telecommunications a vital part of any organization's nervous system for employees, customers and suppliers. Business continuity is part of the IT managers' priority list because network failure or congestion has immediate negative impacts on organizations.

The third generation of our products is a breakthrough to the possibilities of today's organizations being able to handle network redundancy for building smarter networks. I'm excited that Elfiq now has a European base for its operations and see great potential to start in the UK market," said Ghislain Lachapelle, Executive Vice-President of Elfiq inc.

Having been involved with the European network market for over twenty years, Mark Hyland said "I'm extremely excited by the Elfiq technology opportunity and the addressable markets. The intelligent WAN optimization and load balancing market in the UK and Europe is still in its infancy, and with the carrier grade Elfiq products we are able to deliver valuable solutions to both the ISP and enterprise markets." He added, "Any company that has an Internet connection or a wide area network is a potential customer for Elfiq products, which covers most companies in the UK."

The Elfiq Link Load Balancer guarantees optimal access to your network and applications for business continuity while optimizing your multi-homed network throughput. Today's projects must justify a quantitative ROI, and Elfiq products satisfy this criterion. Advanced functions like geographic load balancing and VPN multiplexing make it a key element on disaster recovery projects to provide constant, optimal access to the enterprise's IP services.
